General information

**BOOK INDEX** 

**SECTION INDEX** 

#### 1. General information

Ball valves are utilised to shut-off pressurised media in systems which incorporate rigid tubes or hoses.

When designing a system, the medium, pressure, temperature and other factors will influence which ball valves are selected, in terms of the materials of the body of the valve, the seals and the seats. Using media which are unsuitable for the materials and performance of the valve will reduce its operating lifespan. It is always important to adhere to the pressure and temperature limitations of the selected valve (ball valve bodies are often marked with these performance parameters).

When designing a system, it is also important to take into account any peaks or impulses in the pressure which the valve is intended to handle. These valves are designed to operate in line with the pressure rating of the other components of the system, such as fittings, flanges and tube / pipe.

Ball valves are opened and closed by means of a 1/4 turn of the handle. In accordance with EN ISO 5211.8, the handle must be turned clockwise to close the valve. The notch in the face of the spindle plate indicates the current position of the ball.

Ball valves can be manually operated, or may be actuated. Please inform us as to the method of intended operation when ordering.

When attaching valve control accessories such as actuators or limit switches, please refer to the operating instructions provided by the accessory manufacturer.

In relation to ATEX, the valves are considered as non-electrical equipment and therefore according to EC directive 94/9/EG are not considered an ignition source.

#### 2. Fitting guidelines

Before installation, it is important to check that the valve is free from transit damage and is suitable for its intended application. Never install a damaged valve. All tubes and flexible hoses should be flushed before connecting to the valves to ensure contaminants cannot damage the seals and the seats of the valve, which may cause leaks and malfunction. The system must be de-pressurised and installation must only be undertaken by a qualified operator.

All rigid tubes must be free of tension when connecting to the valve. Additionally, when connecting to the valve it is essential that a spanner

is attached to the valve end adapter to prevent the valve from disassembling whilst the connection is made. Any disassembly of the valve invalidates the warranty. After the valve has been installed, the system should be tested for correct operation.

When dealing with poisonous, explosive or otherwise dangerous media, it is essential to completely drain the system to prevent injury, PPE should be worn at all times

Flanged ball valves require that the connecting flange must be centred with the bolts of the flanges before tightening. If necessary, the assembled valve must be hoisted into place, assembled. Always use a new, undamaged, intermediary flange seal as per the connection standards. Appropriately rated bolts and nuts must be used and always check the length of the required flange bolts.

With regard to valves with welded connections, it is important that no welding residue finds itself within the inner workings of the valve and that during welding that the temperature of the valve does not increase to the point that the internal sealing materials are damaged.

Once again, never exceed the published performance data for any valve.

#### 3. Initial operation

Before initial operation, it is important that all instructions have been read and implemented.

Installation and initial operation (commissioning) should only be undertaken by qualified personnel.

If a valve has been stored for some time, or if a valve has been fixed in one position for some time, it may require more torque than normal to operate.

Any newly commissioned system must be bled to remove any gas bubbles which could cause an explosion if the system is abruptly pressurised. Therefore, incremental increases in pressure are recommended.

When ball valves are used as pipeline ends, the open end must be closed correctly, because any incorrectly tightened components could cause injury or death.

#### 4. Maintenance and surveying

When de-pressurising and draining a system, in order to prevent it from frost damage or for cleaning, the internals of the valve should be drained by moving the handle to the 45° position. The ball valve must not be detached from the system. Sealants should

phone: 0800 9990 316

#### General information

**BOOK INDEX** 

**SECTION INDEX** 

never be used. All ball valves should be inspected at regular intervals to check for leaks, function and damage. If a valve is in a heavy duty application, it should be inspected more regularly.

Ball valves which are installed for long periods without being operated should be turned at least every six months to preserve its functionality.

After inspection, if a valve is found to be dysfunctional, ie leaks, frozen in position, corroded etc. it should be replaced immediately.

#### 5. Removal instructions

Removal of any valve should be conducted by qualified personnel only and only once the system (and valve by moving the handle to the 45° position) has been depressurised.

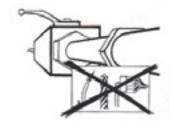

When dealing with harmful media, it is important to completely drain the system whilst wearing appropriate PPE.

#### 6. Warning

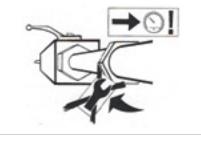

Secure adapter during installation

No welding, drilling, etc.

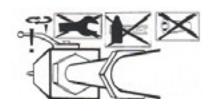

Don't remove under pressure

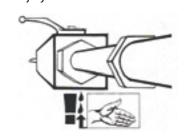

Don't dismantle

Don't operate a ball valve with a tool or an extension

Risk of injury from media residue.

#### General information

**BOOK INDEX** 

**SECTION INDEX** 

Please adhere to the guidance provided in this general information, as the valve manufacturers assume no liability when these guidelines are not followed. The ball valves are only to be used for the applications described by the manufacturer.

Damaged caused as a result of incorrect installation, or handling by unqualified personnel is not covered under the manufacturer's warranty.

The operating range of the ball valves is strictly between its end stops. The valves must be operated in either fully open or fully closed positions only.

Ball valves are not approved for controlling or throttling flow. Operating the valve in an intermediate position can cause damage to the valve seats, which in turn, leads to leaks or spindles that will no longer turn. Additionally, flow reduction leads to a considerable rise in temperature on the surface of the valve.

Do not use tools (eg. extension bars, spanners, wrenches, hammers) to operate the valve. Using any of these such tools can damage the spindle and the body.

Any special applications or operating environments, such as humidity, vibration, operating frequency, electromagnetic fields, explosive zones, antistatic etc, should be considered and mentioned when ordering.

The ball valves must be used for compatible media only. Semifluid or hardening media must never be used.

Avoid medium contamination. Contaminated media leads to damage of the valve components, thereby leading to valve failure.

Temperature limits must be adhered to, otherwise the valve may fail prematurely. Valves must be stored as supplied in a dry, contamination-free environment away from direct sunlight. Only remove the protective caps just before installation.

When installing a valve in an explosive zone, limit the operating frequency to 10/min to prevent the valve frictions from self-warming.

Subjecting the valve to excessive pressures and temperatures beyond its published operating parameters will lead to failure of the valve. In this event, injury up to and including death may occur.

Any user modification of the valve design, especially the drilling of mounting holes or the attachment of welded plates invalidates any warranty and is therefore not advised in any way. In the event a valve fails, the valve must be replaced immediately by a qualified professional after the system has been depressurised. If necessary, the entire system must be shut down.

Any valve repairs should only be performed by the manufacturer. Any disassembly / stripping / servicing of the valve invalidates any manufacturer guarantee.

Please refer to local legislation regarding accident prevention, safety regulations in the geographical area of installation.

Before any maintenance is performed on the valves, the following should be actioned:

Disconnect actuator power supply.

Exclude the possibility of 3rd party accidental system start-up.

Depressurise and drain the system.

Be cautious of any potentially harmful medium residue and wear PPE.

Where applicable, allow the system to cool.

Never exceed the product parameters of pressure, temperature and media.

#### Warning!

Incorrect product selection or usage of any product featured in this catalogue, or failure to follow published safety instructions invalidates any warranty and more importantly, may result in serious injury, including death.

The information provided by Pegasus Hydraulics Ltd is to be used as a guide for professionally qualified installers only. Ultimately, it is the responsibility of the customer to assess all of the factors before ordering a product. All aspects of the product, its performance, its limitations, the environment, the medium, the safety requirements, the service requirements etc should be assessed before making a selection.

The products described herein, including without limitation, product features, specifications, designs, availability and pricing are subject to change by Pegasus Hydraulics Ltd at any time without notice.

#### **RKH** ball valves

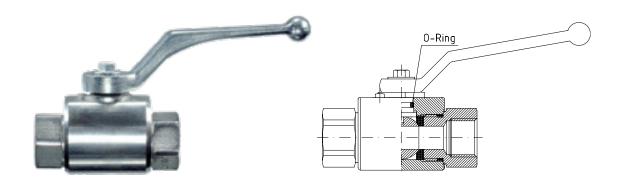

DN 4 to DN 50

The body, end connections, ball and stem are material 1.4571 – AISI 316Ti stainless steel.

Each ball valve is subjected to an inspection before despatch.

Inspection control certificates 3.1 B or 3.1 C per DIN EN 10204 can be supplied on request against invoice.

Other materials as 254Smo or Hastelloy, etc. on request.

# High pressure shut off valve

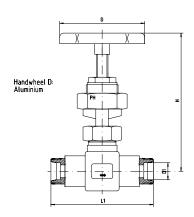

**BOOK INDEX** 

SECTION INDEX

With externally threaded spindle compression connection to ISO 8434-1 / DIN 2353

**Note:** Adjust the graphite packing before initial operation.

Series		Tube O.D.	Thread	Approx. Dimensions			Part code	
	PB	D1	G	D	Н	L1	OMD	
S	400	6	M 14 x 1.5	125	124		HVb-S-06-OMD
